

Step 3: Design Your System (Calculate how much drip you can water at one time)

With your gallons per minute calculation, how much drip tape can you use at one time?

$$\frac{\text{Gallons Per minute}}{\text{gpm per 100ft}} = \text{number of 100 ft lengths}$$

$$100 \text{ GPM} / 3.0 = 33.3$$

$$33.3 \times 100\text{ft} = 3,330\text{ft}$$

Pump can handle 3,330ft of drip tape

22 lines, 150ft long

Find flow rate on label of drip irrigation package

- Example: 3.0 GPM per minute/100ft of drip tape

GPM of water source / GPM of Drip tape X 100ft

Step 3: Design Your System (Calculate how much drip you can water at one time)

Example: You have 60 lines of drip tape, each line is 200ft long.
The flow rate is 2 gallons per minute for every 100ft of drip tape.

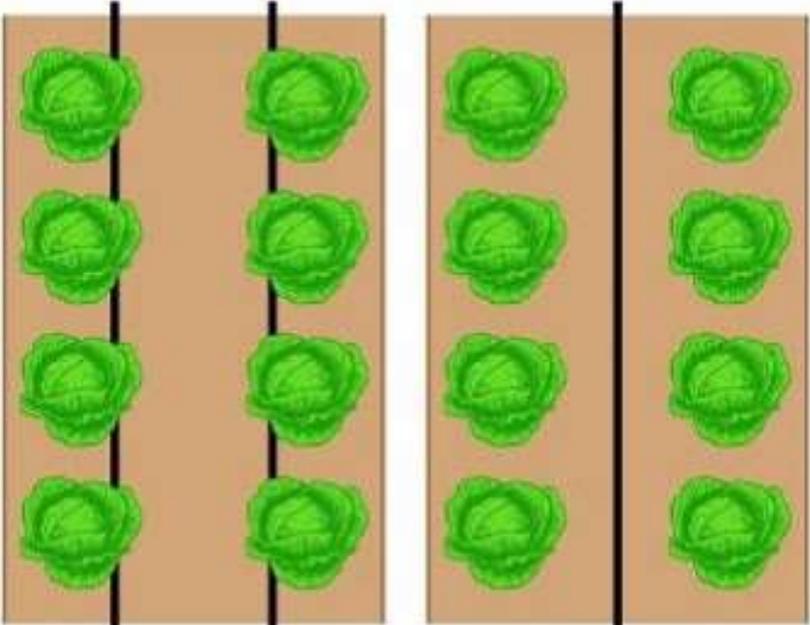

$$\begin{array}{r} \text{\# of lines of drip tape} \\ \times \\ \text{Length of drip tape} \\ \hline = \text{Total length of drip tape} \end{array}$$

$$\begin{array}{r} \text{Total length of drip tape /} \\ \text{specified length} \\ \times \\ \text{GPM of} \\ \text{specified length} \\ = \text{Total GPM required} \end{array}$$

How much water do you need?

Row Spacing

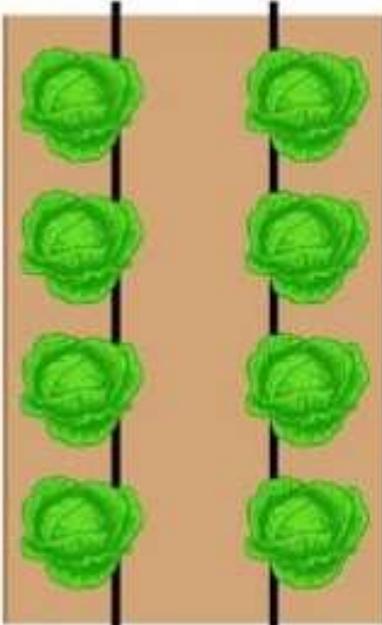

2012

Two lines of 1.75L/hr drip line per bed

One line of 3.75L/hr drip line per bed

2013

Two lines of 1.6L/hr drip line per bed

Underground Installation

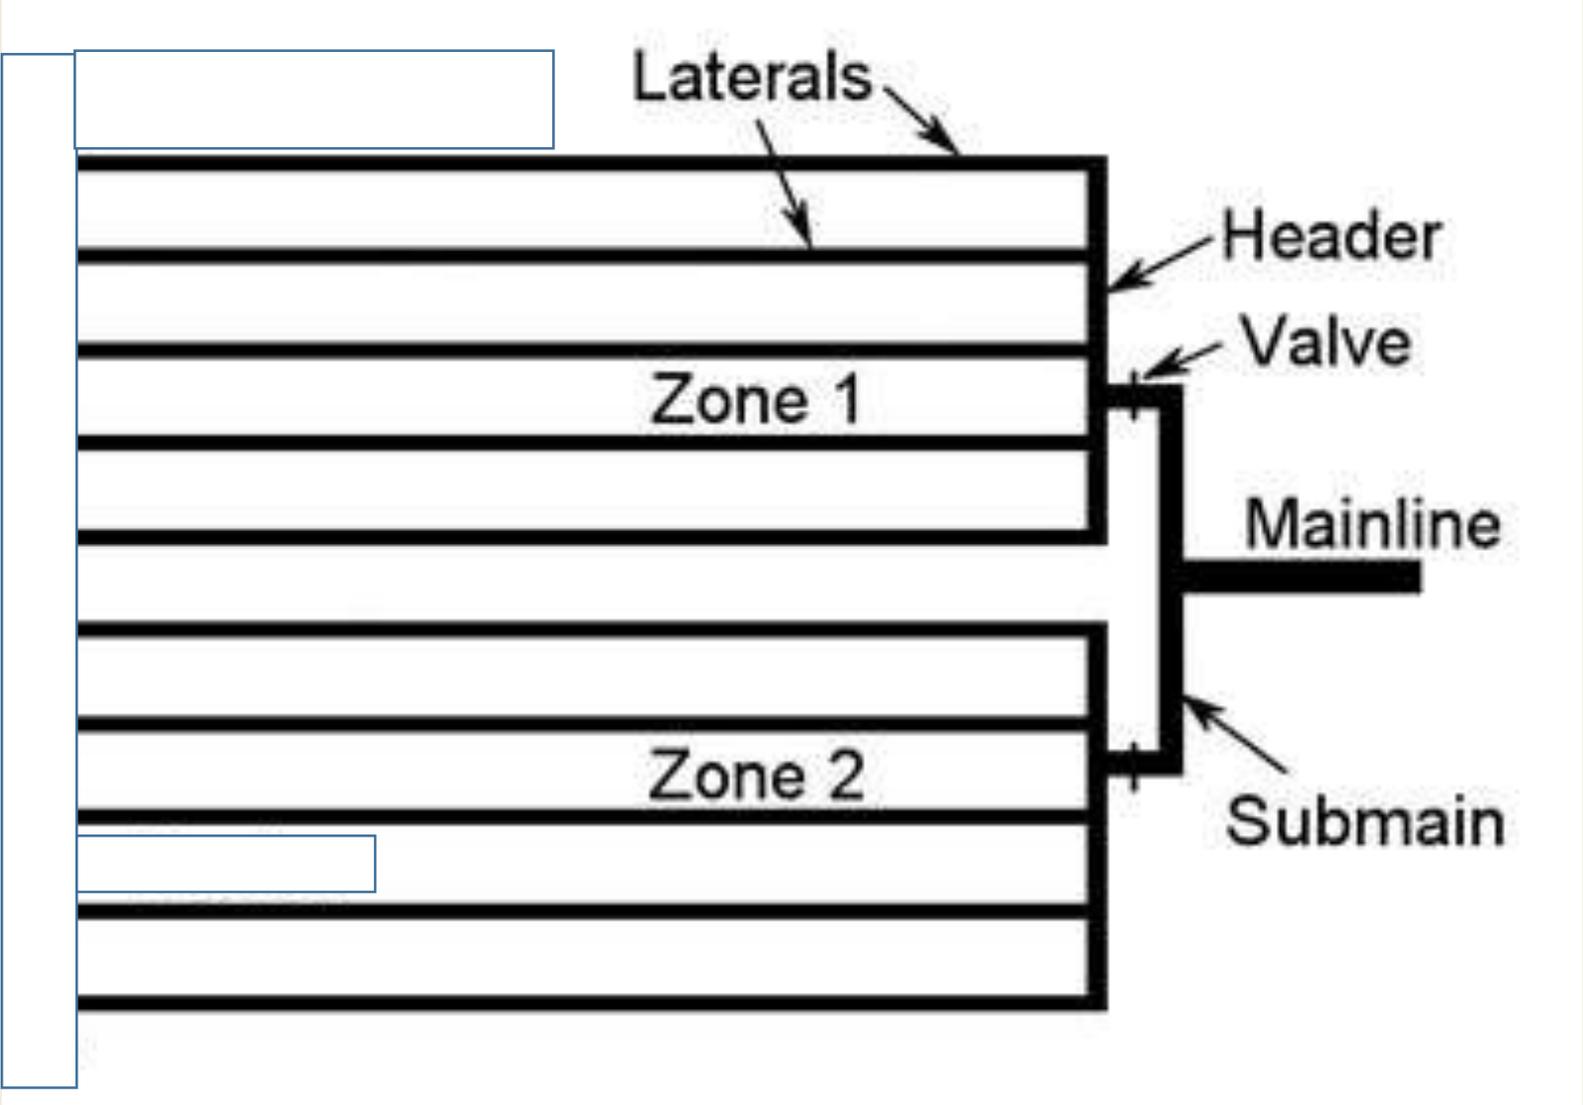

Pros

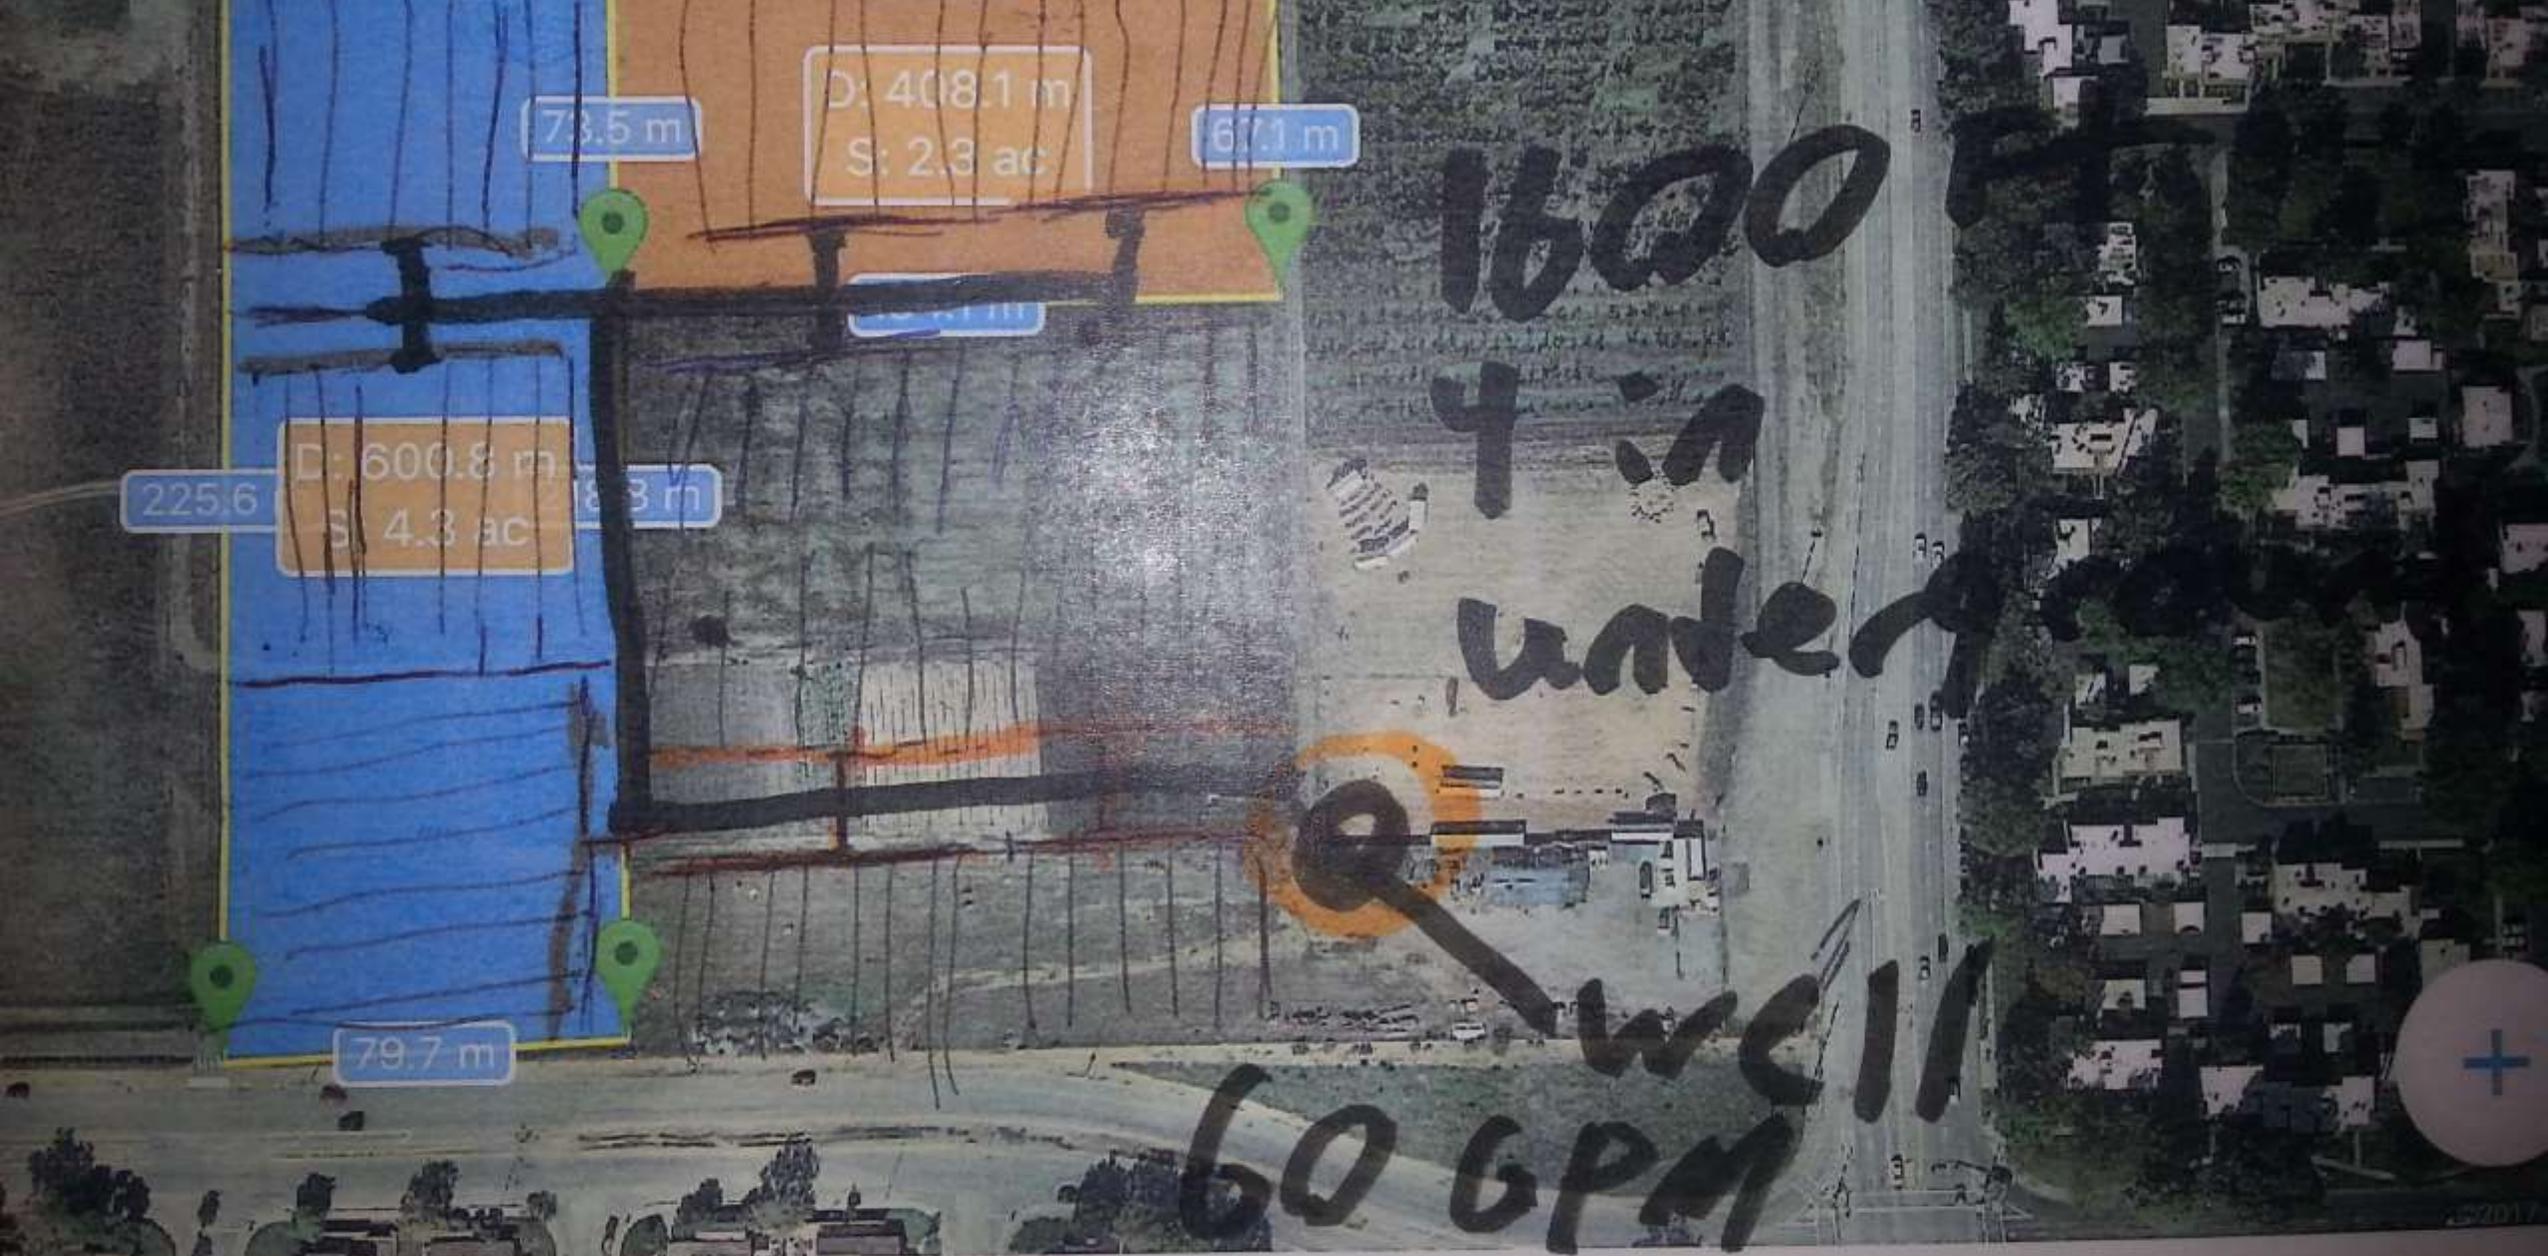

- You won't drive over your pipes
- Once installed, easy to use
- Simply glue pipes together

Cons

- Difficult to install in wet soil
- Difficult to repair if there is a leak

Orchard Irrigation

Step 3: Design Your System (Trees)

You have emitters that water trees 2 gallons per hour.
There are 2 emitters per tree. You want to give 100 gallons per tree per watering. Your orchard contains 300 trees.

How many gallons per minute do you need?

$$\begin{array}{r} 2 \text{ gallons/hour} \\ \times \\ 2 \text{ emitters/tree} \\ \times \\ 300 \text{ trees} \\ \hline =1200 \text{ gallons per hour} \end{array}$$

$$\begin{array}{r} 1200 \text{ gallons per hour} \\ / \\ 60 \text{ minutes} \\ \hline =20 \text{ gallons per minute} \end{array}$$

Step 3: Design Your System (Trees)

How long do you need to water?

$$\begin{array}{r} 2 \text{ gallons/hour} \\ \times \\ 2 \text{ emitters/tree} \\ \hline =4 \text{ gallons/hour} \end{array}$$

$$\begin{array}{r} 100 \text{ gallons/tree} \\ / \\ 4 \text{ gallons/hour} \\ \hline =25 \text{ hours} \end{array}$$
